WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Skids: two 60 x 60 x 3 tubes 1,000 long, 520 apart (centres).
Cross tubes: four 50 x 50 x 3 tubes 460 long between the skids,
tops flush with the skid tops, centred 25, 405, 670 and 975
from the lever end of the skids. Weld all round.
Base plate 12 mm, 315 x 340, on the two middle cross tubes,
380 to 695 from the lever end; 8 x 13.5 holes for the core
feet and 2 x 11 holes for the guard feet (see the plan).
Lever bracket: two 10 mm plates (EPR-DWG-102), inner faces
120 apart, standing on the end cross tube; weld both sides.
Rest stop: 30 mm round bar 120 long between the bracket plates.
Ties: two 40 x 3 round tubes 358 long, ends slotted over the
bracket plates, other ends welded to 10 mm tabs 88 x 80.
Eject posts: two 10 mm plates 60 wide, 31 hole 536 above the
base plate, 120 apart inside, welded upright on the base plate.
Weld with the bracket shaft and both tab holes on a dummy
core jig, so the bolts line up. Check: frame sits flat.
