WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Walls 12 mm, 200 tall: two long walls 314 long, two end walls
140 long between them. Cavity 290 x 140, open top and bottom.
Weld outside only; grind the cavity faces flat and square,
within 0.5 mm; break the top and bottom inside edges 1 mm.
Belt: 16 x 50 bar round the top, flush with the rim.
Side flanges: 16 mm plates 120 x 150 under the belt on the
long walls. Before welding, drill 14 and tap M16 in 4 places:
on the centre line, 20, 57, 93 and 130 up from the bottom edge.
Hinge lugs (+X end) and latch lugs (-X end): 20 mm plates on
the belt ends, inner faces 144 apart; 31 holes 37 out from the
belt, 10 above the rim (hinge) and 25 below it (latch).
Drill each lug pair together on a bar so the pins slide in.
Fit: flanges slide between the column webs (shim to 0.5 mm).
Check: a 288 x 138 plate passes through the cavity freely.
